Question 1   12.5 / 12.5 points

When you use the Management Studio to create a database, including its tables and indexes, the Studio actually generates and runs the _____ statements that are necessary to create the database.

Answer: SQL ✔

Question 2   12.5 / 12.5 points

If you use the Management Studio to create a database, the Studio will automatically create a database file plus a _____ file.

Answer: transaction log ✔

Question 3   12.5 / 12.5 points

When you use the Management Studio to create a table, all of the constraints are at the _____ level so they can refer to any of the columns in the table.

Answer: table ✔

Question 4   12.5 / 12.5 points

When you use the Management Studio to create a foreign key constraint, you specify the relationship between two tables as well as the rules for enforcing _____.

Answer: referential integrity ✔

Question 5   12.5 / 12.5 points

When you use the Management Studio to create a check constraint, you can specify whether you want the constraint enforced for insert or _____ operations.

Answer: update ✔

Question 6   12.5 / 12.5 points

Whenever you use the Management Studio to create, alter, or delete database objects, you can save the _____ that it used for doing that.

Answer: script ✔

Question 7   12.5 / 12.5 points

You can use the Object Dependencies dialog box of the Management Studio to do all but one of the following. Which one is it?

○ Review the tables that a specific table depends on

✔ ◉ Review the stored procedures and views that a specific table depends on

○ Review the stored procedures and views that depend on a specific table

○ Review the tables that depend on a specific table

Question 8   **12.5 / 12.5 points**

Some database designers write their own SQL statements for creating a database, its tables, and its indexes, instead of using the Management Studio. They do that for all but one of the reasons that follow. Which one is it?

✓ ⦿ They're less likely to make syntax errors as they implement the database.

○ It's easier to modify your own script if you want to use it to create the same database for another database management system later on.

○ They want to have complete control over how the database is created.

○ The scripts generated by the Management Studio are harder to understand.
